Job Description

Subject

We're hiring a senior front-end engineer to own a React and TypeScript surface that serves millions of requests. You'll collaborate with design and product to deliver accessible, fast experiences.

Required: strong React, TypeScript, and state management (Redux or equivalent). Experience with **React Native** is a plus, as we share components with our mobile team and maintain a light module bridge.

You'll integrate with both REST and GraphQL backends. The team maintains OpenAPI definitions, uses Swagger for docs, and Postman for smoke checks. Quality: you should be comfortable with Jest and Playwright/Cypress, and familiar with BDD using Cucumber when it adds value.

Delivery: Docker for local dev, Kubernetes (EKS) in production, Helm for packaging. We use Argo CD to promote between environments.

Infrastructure: most resources are provisioned with Terraform; secrets via Vault; observability with Prometheus, Grafana, ELK, and some OpenTelemetry traces wired into Jaeger.

CI/CD: GitHub Actions primarily, with some legacy Jenkins jobs.

Data: PostgreSQL for OLTP, Redis for cache, Kafka for event streams.

Cloud: AWS (S3, CloudFront, Lambda, CloudWatch), with limited GCP experimentation (Cloud Run).

Nice-to-have: familiarity with TailwindCSS, design systems, and WCAG accessibility standards; exposure to mobile release tooling (fastlane, Gradle).
